The joint-stock company is introducing a new product. Annual production is expected to be 100,000 pieces. Direct material costs per unit are CZK 100, direct wages CZK 20. Variable production overheads amount to 100% of direct wages. In addition to the existing machinery, the production will require another single-purpose machine, which will be acquired in the form of a lease with an annual rent of CZK 500,000. The financial plan requires that the total contribution to cover common fixed costs and profit generation be in the absolute amount of CZK 5,000,000. The marketing department recommends a price in the range of 190 to 210 CZK, at which the demand will be around 100,000 pieces.

Make a cost calculation of the price of 1 piece of a new product:

| Direct material               | CZK |
|-------------------------------|-----|
| Direct wages                  | CZK |
| Variable production overheads | CZK |
| Specific fixed costs          | CZK |
| Unit contribution for payment | CZK |
| Suggested price               | CZK |

What will be the price of the product?

| The suggested | price | is | CZK/unit |
|---------------|-------|----|----------|
|---------------|-------|----|----------|

# Exercise 2

The following unit cost calculation (CZK / pc) is currently valid for the ABC product in the company:

| CZK/unit (piece)                       |     |  |  |
|--|-----|--|--|
| Sales price of the product             | 500 |  |  |
| - Variable costs                       | 300 |  |  |
| = Payment allowance                    | 200 |  |  |
| - Fixed costs allocated to the product | 120 |  |  |
| = Profit per product                   | 80  |  |  |

This calculation is valid for a product (and sale) of 50,000 products.

The company's management is considering a new situation where we managed to acquire a new large customer and agree with existing customers to increase deliveries, which could lead to a doubling of the number of manufactured pieces. However, the condition is to reduce the price to CZK 400 / pc.

The increase in production necessitated an increase in total fixed costs by 50%, mainly due to the necessary expansion and modernization of production. Increasing production and modernizing the process (volume discounts and increasing labor productivity) will also have an impact on reducing unit variable costs by 20%.

### Assignment:

- 1. Determine a unit calculation for the new situation
- 2. Determine the original total profit.
- 3. Determine the new total profit.
- 4. Determine the change in total profit.
- 5. Calculate the original break-even point.
- 6. Calculate the new break-even point.
- 7. Calculate the break-even point change.
- 8. What factors influenced the change in profit?
- 9. Determine a unit calculation if the unit variable costs could not be reduced.
- 10. Determine the original total profit.
- 11. Determine the new total profit.
- 12. Determine the change in total profit.
- 13. Determine a unit calculation with respect to task ad 1), if the increase in total costs will not be 50%, but 70%.
- 14. Determine the original total profit.
- 15. Determine the new total profit.
- 16. Determine the change in total profit.

| CZK/unit (piece)                       |     |  |  |
|--|-----|--|--|
| Sales price of the product             | 500 |  |  |
| - Variable costs                       | 300 |  |  |
| = Payment allowance                    | 200 |  |  |
| - Fixed costs allocated to the product | 120 |  |  |
| = Profit per product                   | 80  |  |  |

| CZK/unit (piece)                       |     |  |  |
|--|-----|--|--|
| Sales price of the product             | 500 |  |  |
| - Variable costs                       | 300 |  |  |
| = Payment allowance                    | 200 |  |  |
| - Fixed costs allocated to the product | 120 |  |  |
| = Profit per product                   | 80  |  |  |

| CZK/unit (piece)                       |     |  |  |
|--|-----|--|--|
| Sales price of the product             | 500 |  |  |
| - Variable costs                       | 300 |  |  |
| = Payment allowance                    | 200 |  |  |
| - Fixed costs allocated to the product | 120 |  |  |
| = Profit per product                   | 80  |  |  |

The following unit calculation for the provided Service X (CZK for the provided event) is currently valid in the ZETA company.

| CZK/unit (piece)                                   |     |  |  |
|--|-----|--|--|
| Sales price of the service                         | 900 |  |  |
| -variable costs                                    | 400 |  |  |
| =allowance for payment I                           | 500 |  |  |
| - fixed costs directly attributable to the service | 200 |  |  |
| = allowance for payment for service II             | 300 |  |  |
| - fixed common costs (per unit of service)         | 150 |  |  |
| = profit per unit of service                       | 150 |  |  |

This calculation, based on the division of costs into fixed and variable, is set for a range of activities of 20,000 shares for a given period.

Based on the market analysis, the company's management came to the conclusion that the overall market potential is in favor of increasing the scope of service provision to 50,000 events. The condition is a reduction in the service to the price of CZK 800 / j. The increase in the scope of service provision entails an increase in direct fixed costs of the service by CZK 4 million, mainly due to the need to add new technology for service provision and service promotion.

At the same time, the acquisition of modern technology will reduce labor in the provision of services, which means a reduction in unit variable costs by 10%. The company's common fixed costs do not change, and therefore the total amount of these costs that this service is to cover in total will not change.

### <u>Assignment</u>

- 1. Determine a new cost calculation per unit of service.
- 2. Determine the original total profit.
- 3. Determine the new total profit.
- 4. Determine the change in total profit.
- 5. Determine the original break-even point.
- 6. Determine a new break-even point.
- 7. Determine the break-even point change.

8. Calculate the extent to which the service (number of units of service provided) will achieve the same economic result in the new situation as in the initial situation.

9. Calculate at what price the same economic result will be achieved as in the initial situation.

| CZK/unit (piece)                                   |  |  |
|--|--|--|
| Sales price of the service                         |  |  |
| -variable costs                                    |  |  |
| =allowance for payment I                           |  |  |
| - fixed costs directly attributable to the service |  |  |
| = allowance for payment for service II             |  |  |
| - fixed common costs (per unit of service)         |  |  |
| = profit per unit of service                       |  |  |

An easy-to-manufacture industrial plant produces only one type of product. Its production process is characterized by the fact that there is no work in progress and all products put into production are completed and sold in the current period. In the current period, the following costs were incurred (in CZK):

| Direct material          | 64 000  |
|--------------------------|---------|
| Direct wages             | 13 660  |
| Power consumption        | 18 380  |
| Depreciation             | 10 000  |
| Other purchased services | 3 580   |
| Total                    | 109 620 |

The company produced 1900 tons of product.

### Assignment:

- 1. Determine the final calculation per 100 kg of product.
- 2. Determine the final calculation per 100 kg of product in the items direct material, direct wages and production overheads.

Solution 1)

| Direct material          |  |
|--------------------------|--|
| Direct wages             |  |
| Power consumption        |  |
| Depreciation             |  |
| Other purchased services |  |
| Total                    |  |

#### Solution 2)

Retail intends to expand its offer with a new kitchen appliance; the purchase price is CZK 2,000. The usual 20% surcharge (trading margin) is CZK 400. Direct selling costs represent 10% of the selling price (commissions, discounts). The survey found the elasticity of demand for the price:

| Price    | 2 800 | 2 600 | 2 500 | 2 400 | 2 300 |
|----------|-------|-------|-------|-------|-------|
| Quantity | 15    | 25    | 37    | 48    | 60    |

- a) Complete the following table on the prices of the kitchen appliance or the usual calculation of full costs + profit
- b) Find out the most favorable selling price of the product

Solution a)

| Price per piece   | 2 800 | 2 600 | 2 500 | 2 400 | 2 300 |
|-------------------|-------|-------|-------|-------|-------|
| -10%              |       |       |       |       |       |
| Subtotal          |       |       |       |       |       |
| -Purchase price   |       |       |       |       |       |
| = profit per unit |       |       |       |       |       |
| x number of       |       |       |       |       |       |
| units             |       |       |       |       |       |
| = total profit    |       |       |       |       |       |

Solution b)

The most favorable selling price of the product is .....

The company produces one type of product A. Preliminary calculation of full costs is based on the assumption that the volume of production and sales will be 50,000 pieces in the period under review and includes the following items:

| Items                                | CZK/unit |  |  |
|--------------------------------------|----------|--|--|
| Direct material                      | 30       |  |  |
| Direct wages                         | 10       |  |  |
| Production overhead (CZK 2 500 000 / | 50       |  |  |
| 50 000 pcs)                          |          |  |  |
| Full production costs (Total costs)  | 90       |  |  |

In a more detailed analysis of production overheads, it was found that only a fifth of them have a variable character. The remaining part consists of fixed costs, which are an expression of the created production capacity. This enables maximum production for the monitored period in the range of 60,000 pieces.

• Find out how much the average cost of production per piece of product A produced and sold will be 40,000 pieces and 60,000 pieces.

### Exercise 7

The company produces one type of product A. Preliminary calculation of full costs is based on the assumption that the volume of production and sales will be 50,000 pieces in the period under review and includes the following items:

| Items                                | CZK/unit |  |  |
|--------------------------------------|----------|--|--|
| Direct material                      | 30       |  |  |
| Direct wages                         | 10       |  |  |
| Production overhead (CZK 2 500 000 / | 50       |  |  |
| 50 000 pcs)                          |          |  |  |
| Full production costs (Total costs)  | 90       |  |  |

In a more detailed analysis of production overheads, it was found that only a fifth of them have a variable character. The remaining part consists of fixed costs, which are an expression of the created production capacity. This enables maximum production for the monitored period in the range of 60,000 pieces. The selling price of product A is CZK 100 and the company has produced 50,000 pieces of products in three consecutive periods. However, the sales volume fluctuated: in the first period the company sold the entire production volume (50,000 pieces), in the second only 40,000 pieces and in the third 60,000 pieces. In the production of products, the company did not save or exceed the estimated costs set out in the previous part of the tender.

- Find out the results of the company's management
- a) When valuing performance at the level of full costs
- b) When valuing them at the level of variable costs

Trade organizations export products A, B, C. Data on exports and costs are given in the table.

|                     | А     | В  | С  |
|---------------------|-------|----|----|
| Quantity            | 60    | 50 | 45 |
| Unit price          | 85    | 75 | 60 |
| Unit variable costs | 20    | 25 | 30 |
| The fixed costs     | 5 700 |    |    |

- Calculate the payment fee per piece of product and the total contribution.
- Determine the order of advantage of exporting products.
- Recommend which product is not suitable for trading.

### Exercise 9

Calculate the economic result of a company producing 3 products using a multi-stage method of calculating variable costs. The data in the table are given, as well as data on special fixed costs: for product A = CZK 1,100, for product B = CZK 1,400, for product C = CZK 2,000. The general fixed costs amount to CZK 2,300.

|                      | Α     | В     | С     |
|----------------------|-------|-------|-------|
| Total Sales          | 5 800 | 6 400 | 7 600 |
| Total Variable Costs | 2 700 | 3 400 | 4 100 |
